LOCUS
AL133148 40584 bp DNA PPI 06-MAR-2000
DEFINITION Human DNA sequence from clone RP1-79P11 on chromosome Xq21.32-22.1.
Contains the gene for a novel protein similar to mouse Bex2
(brain-expressed X-1nked protein 2), ESTs, STSs, GSSs and a putative Cp6 1sland, complete sequence.
ACCESION AL13334 6 GI:7076386
KEXMONEDS HTG; Bex2; CpG island.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sppiens

The soarence contained an oiigo-df track that was present in the
Oilgonoulcectde that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail: The sequence tag present in the CDNA between the Noil site
and the oilgo-df track served to identify it as a clone from the
normalized actium at 16.5 do ilbrazy Preparation:
M.B. Soares tabb Clone distribution: clones will be available

Double-stranded CDNs was ligated to Eon RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pp713 vector. Library is normalized Library was constructed by Bento Soares and W. Fathma Bonaldo.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the cotal score distribution.
                                                                                                                                                                                                                                                                                                                                              US-09-327-750D-28

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAH82377 to AAH83878 represent human ovarian tumour-associated polynucleotide sequences which encode ovarian tumour proteins. The ovarian tumour protein and polynucleotide sequences have cytostatic activity, and can be used in gene therapy and vaccine production. The ovarian tumour proteins and polynucleotides can be used to inhibit the development of cancer, particularly ovarian cancer. They can also be used to diagnose the onset and progression of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human ovarian tumour associated polynucleotide sequence SEQ ID NO:210.

The actrinogenesis biomarkers are induced by treating ret heptocytes with phenobarbitol. The nucleic acids are acid set in feptocytes with phenobarbitol. The nucleic acids are can be used to derive probes and/or primers for detecting or inducing carcinogenesis, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 getetetaateaccacgaccatcacgatgaattetgeettatgeettgaetteggteatt 120

the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cONAs. The primers are also useful for the detection and/or disgnosis of the abnormality of the proteins encoded by the full-length cONAs. The primers allow obtaining of the full-length ADMSs. The primers allow obtaining of the full-length ADMSs. The primers allow obtaining of the full-length ADMSs. The present human cDNA sequences; ADMS246 to ADMSS33 represent human cDNA sequences; ADMS246 to are represent oligonuclectides, all of which are used in the exemplification of the present invention.

The sequences given in AAC85545-72 encode human polypeptides involved to the sequences given in AAC85545-72 encode human polypeptides and agonists of these are used to treat a disease or condition associated with decreased expression of functional loster. A mategorist of CDIFF is decreased expression of functional loster of CDIFF is condition associated with over expression of functional loster. CDIFF polypeptides may be used for the treatment, confunction and disporders, supplyeptides may be used for the treatment, conversion and disporders, and a Alianders and sequence is homologous to Man musculus and expression are policysy. The CDIFF-4 sequence is homologous to Man musculus and playsy. The CDIFF-4 sequence is homologous to Man musculus in 157.4 to 158 0 centimorgans, to chromosome 3 within the interval from from 104.2 to 156.0 centimorgans and to the X chromosome within the interval
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  380 gatgaatgacgggttgggtggggatggagatgatatggaaatgttcatggaggatgag 439

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the coding sequence for human X chromosome linked there expression protein in 14. The protein and coding sequence are useful for treating diseases e.g. cancer and HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human cell cycle and proliferation protein CCYPR-22 cDNA, SEQ ID NO:76.

cell cycle and proliferation proteins (CYPR) ABBG053-ABB0506.

Cell cycle and proliferation proteins (CYPR) ABBG056.

CCTPR and agonists of CCTPR are used to treat diseases or conditions
associated with decreased expression of functional CCTPR, while CCTPR
antagonists are used to treat diseases or conditions associated with
Overexpression of functional CCTPR. Monocloan or polycloan antibodies

CC confoundments are used to treat diseases or conditions associated with
Overexpression of functional CCTPR. Monocloan or polycloan antibodies

CC compounds est, antibodies oligionuclectides and proteins (receptors)
that specifically bind to CCTPR, and in drug screening methods to
incledides can be used to generate transgenic animal models of human
disease, and can be used to generate transgenic animal models of human
disease, and can be used to generate transgenic animal models of human
disease, and can be used to generate transgenic animal models of human
disease, and can be used to generate transgenic animal models of human
disease, and can be used to generate transgenic animal models of human
diseases which can be used to generate aspectated with CCTPR.

CC Diseases which can be diagnosed, treated and prevented using CCTPR
proteins, nucled calds, agonists or antagonists include immune,
discoders including cancer. Specific examples of these discreters
classforces including cancer. Specific examples of these discreters
classforces include annema, epilepsy, arteriosolerosis, asthma, cancer, allergies,
clabels are mediated the menstrual cycle and infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         316 accaccgaagagccaggctcgccctcaacttccgatgggccattcccaaca 375

The present sequence is one of a large number of 5' ESTs derived from canna encoding secreted proteins. An ORP has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs or polyA+ RNAs or polyA+ RNAs or polyA+ CATS of ESTs were set asually correspond an anny to the 3' untranslated region (UTR) of the mRNA because they are often otherhed from oilgo-dryptimed chank librates. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of the mRNAs and even in those cases where longer cDNA sequences have been obtained; the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intent f' ends and can therefore be used to obtain full length contained. The full 5' UTR is rarely included. 5' ESTs are derived from mRNAs and genomic DNAs. 8' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain cutting contain wetches. They are used to obtain we vectors.

A single-stranded DNA (or its complementary strand or the corresp. Co double-stranded DNA) which comprises one of the 7837 'GS' sequences of quent in AAT19001-72687 and which is able to hybridise to part of given in AAT19001-72687 and which is able to hybridise to part of complement DNA, cDNA or make is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed onthe libraries prepared from the complement of the property of the particular walks specified and bundance of the appearance frequency of a given GS in a onstructuded so as to reflect accurately the relative abundance of the appearance frequency of a given GS in a obtain it was desired. The appearance frequency of a given GS in a obtain it was desired. The appearance frequency of a given GS in a obtain it was desired. The appearance frequency of a given GS in a constructude of the primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       788 cttctatttgaagattgcctttgcactcagtgtaagtttctgtcagcagtagtttcacce 847

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAM82377 to AAM83878 represent human ovarian tumour-associated polynucleotide sequences which encode ovarian tumour proteins. The ovarian tumour protein and polynucleotide sequences have cytostatic activity, and can be used in gene therapy and vectoria protein. The ovarian tumour proteins and polynucleotides can be used to disciplinity the development of cancer, particularly ovarian anner. They can also be used to dispose the onset and progression of cancer. They can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           791 ctattigaagatigocittigoacteagigtaagittotgicagoagigagittoacocatt 850

complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to a complementary and sequence and an oligonuclectide comprises a 3'-end sequence, where the polynuclectide which comprises a 3'-end sequence, where the compination of coligonuclectide comprises at least 15 nuclectides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for sphtebalship polynuclectides, contained to particularly full-length conka. The primers are also useful for the detection and/ord disgnosis of the abnormality of the proteins encoded by contained to Ahilb'12 represent them conka sequences; Ahilb'12 and Ahilb'12 represent human amino and sequences; Ahilb'12 to Ahilb'12 represent human amino and sequences; and Ahilb'22 to Ahilb'22 to the present the present three is all of which are used in the exemplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            517 tattcatggagagaqatgagagaaatcagaaqaaaacttagggagctgcagttgaggaatt 576

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes primer sets for suprthesising 5602 full-length CDMs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polymorlectide within comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at less 15 nucleotides, or (b) a combination of an oligonucleotide comprises at less 15 nucleotides.
                                                                                                                                                                     gggccatacccaataggcagatcaatgatgggatgggtggagatggagatgatatggaaa 516

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAF59590-AAF59643 represent CDRAs encoding 54 human cell cycle and proliferation proteins (crcFR), AAB6045-AB60506. CCFR and agonists of CCFR are used to treat diseases or conditions associated with decreased expression of functional CCFR. While CCFR antagonists are used to treat diseases or conditions associated with coverexpression of functional CCFR. Monoclonal or polyglonal antibodies to CCFR may be used in enzyme-linked immunosorbent assays (ELISA) or corpt may be used in enzyme-linked immunosorbent assays (ELISA) or radioimunosasys to detect CCFR. CCFR itself may be used to detect compounds of antibodies, oligonacieotides and proteins (receptors) that specifically bind to CCFPR, and in drug screening methods to

identify compounds that modulate the activity of CCYPR. CCYPR nucleotides can be used to generate transgents annial models of human disease, and can be used to generate transgents annial models of the abnormalities with respect to the expression of CGYPR for the genetic reatment or prevention of a disorder associated with CGYPR. Diseases which can be disponed, treated and prevented using CCYPR proteins, nucled caids, agonists or antagonists include immune, developmental and cell signaling disposed disporders include anneands. Specific examples of these disporders including cancer. Specific examples of these disporders disporders multiply disposed and prevents and disposed successibilities of these disporders and disposed so the menstrual cycle and infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          283 abahacanccagababababatctcatcatggcamatattcaccaggabahcgabaga 342

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /Jac.nost-Dialub

/Jac.nost-Dialub

clone is among a rearrayed set of 15,247 clones from 11

embryo cDNA libraries (including preimplanetation stage

embryos from unfertilized egg to blastocyst, embryonic

part of E7.5 embryos, extraembryonic part of E7.5 embryos

vand E12.5 female mesonephrosygonad) and one newborn

ovary cDNA library. Average insert size 1.5 kb. All

source libraries are cloned unidirectionally with Oligo(dT

)-Not primers. References include: (1) Genome-wide

intrary is a subtracted interpred from a mixture or five individually tagged normalized rat libraries:
    brain-nRBP (20%), heart-nRHP (20%), kidney-nRKP (20%), actra-nRMP (20%), Each original library was constructed from a mixture of equal amounts of RNA from seven different developmental time-points:
    embryonic day 17, embryonic day 19, and adult day 1, adult day 12, adult day 15, and adult day 21, adult day 17, and adult day 200. (Exception: the acrta pool contains only the three embryonic stages). Each library was normalized by Bonaldo, Lennon & Soares (Genome Research Genome 6: 791-806, 1996). For construction of the DrO subtracted individually according to the procedure described by Bonaldo, Lennon & Soares (Genome Research Genome 6: 791-806, 1996). For construction of the DrO subtracted library plasmid DNA from each of the five individually tagged normalized libraries was mixed in the proportions specified above and electroporated into competent bacteria for production of single-stranded circular DNA representing the pool of libraries. Single-stranded circular DNA representing the pool of libraries. Single-stranded circular DNA representing the pool of libraries. Single-stranded circular DNA representing the pool of libraries of about 1,000 arrayed clones from each of the five normalized libraries of brain (CTOS), heart (CSOS). Kidney (CUOS), and placenta (CNOS). The resulting pool of appresented about 2,000 arrayed clones from each of the five normalized libraries of brain (CTOS), heart (CSOS), kidney (COO), and (CTO), heart (CSO), kidney (COO), and (CTO), heart (CSO), and placenta (CNO), and CLONO content (CNO), and CNO) content (CNO), and CNO), and CNO) content (CNO) cont
      library is a subtracted library derived from a mixture of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       453
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    49
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        99

The sequence contained an oligo-dr track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dr track served to identify it as a clone from the normalized rat kidney pool library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through elements were found in this cDNA sequence: 1-51,

Seq Primer: Mi3 Forward

The sequence contained an oilgo-dr track that was present in the
oilgonucleotide that was used to prime the synthesis of first
strand coNA and therefore this may represent a bonafide poly A
trail. The sequence tag present in the cDNA between the NotI site
and the oilgo-dr track served to identify it as a clone from the
normalized atrium at 16.5 dpc library cDNA Library Preparation:
M.B. Soares Lab Clone distribution: clones will be available
through Research Genetics (www.resgen.com)
Seq primer: M13 Forward

The present invention describes primer sets for synthesising 5602

(a) an oligo-dT primer and an oligounclectide complementary

comprises: (a) an oligo-dT primer and an oligounclectide complementary

to the complementary strand of a polynuclectide which comprises one of

the 5602 nuclectide comprises at least 15 nuclectides; or (b) a combination

oligonuclectide comprises at least 15 nuclectides; or (b) a combination

of an oligonuclectide comprising a sequence complementary to the

complementary strand of a polynuclectide which comprises a 5'-end

sequence and an oligonuclectide comprising a sequence complementary to the

complementary strand of a polynuclectide which comprises a 5'-end

sequence and an oligonuclectide comprising a sequence complementary to a

polynuclectide which comprises a 3'-end sequence, where the

oligonuclectide which comprises at 15 nuclectides and the combination of

the specification. The primer sets can be used in antisense therapy and

the specification. The primers are useful for synthesising polynuclectides,

the specification and/or diagnosis of the abnormality of the full-length

complementary any specialised methods. Ash03166 to AAH13628 and

AAH3633 represent human annho acid sequences; and AAH13629 to AAH13632

complement the complement of the primers and AAH13629 to AAH13632

complementary that the complementary and are used in the exemplification
